

Automated Machine Learning (AutoML) for Zero-touch Network and Service Management

Editor: Prithi Samuel, SRM Institute of Science and Technology,
Chennai, India

Malathy Sathyamoorthy, KPR Institute of Engineering and Technology,
Arasur, Coimbatore, India

Rajesh Kumar Dhanaraj, Symbiosis Institute of Computer Studies and
Research (SICSR), Symbiosis International (Deemed University),
Pune, India

Balamurugan Balusamy, Manipal Academy of Higher Education, Dubai
Campus, Dubai, UAE

Automated Machine Learning (AutoML) for Zero-touch Network and Service Management provides a comprehensive examination of how AutoML techniques are transforming next-generation network operations. As modern communication networks continue to grow in scale, heterogeneity, and complexity, traditional manual configuration and management approaches have become increasingly impractical. Zero-touch network and service management (ZSM) has therefore emerged as a critical paradigm for enabling autonomous, self-configuring, self-optimizing, and self-healing networks.

This book bridges the gap between machine learning automation and intelligent network management by exploring the role of AutoML in the design, deployment, and operation of zero-touch networks. It presents fundamental concepts, system architectures, and enabling technologies, while addressing key practical challenges such as model selection, hyperparameter optimization, data scarcity, explainability, scalability, and the lifecycle management of machine learning models in real-world operational environments.

Through in-depth discussions, real-world use cases, and emerging research directions, the book offers valuable insights into applying AutoML across network domains, including software-defined networking, network function virtualization, 5G/6G systems, cloud-native services, and edge computing. It serves as both a research reference and a practical guide, it is an essential resource for researchers and practitioners seeking to build intelligent, autonomous, and resilient networked systems.

TABLE OF CONTENTS

- Introduction to Automated Machine Learning (AutoML) in Network and Service Management: Overview and Significance
- AutoML Techniques and Algorithms for Network and Service Management: Applications and Research Challenges
- AutoML for Network Performance Monitoring and Predictive Maintenance: Service Assurance and Quality Monitoring
- Human-centric Design in AutoML Solutions in Automated Systems for Network Management: Research Directions and Challenges
- AI-enabled Security in Zero-touch Network Environments: Threat Detection and Prevention
- Blockchain and Distributed Ledger Technology in Network and Service Management: Research Challenges and Future Directions
- Edge Computing and Automated Machine Learning for Zero-touch Networks and Service Management: Applications and Future Trends
- Quantum-inspired Machine Learning Applications in AI-driven Network Optimization and Zero-touch Networks
- Federated Learning for Collaborative AutoML in Zero-touch Network and Service Management: Applications and Challenges
- Neuromorphic Computing and Neuromorphic Hardware for AutoML in Zero-touch Network: Applications and Challenges
- Next-generation Networking Technologies and AutoML Integration in 5G, IoT, and Future Networking Paradigms
- AutoML-powered Innovations in Software-defined Networking (SDN) and Network Function Virtualization
- Leveraging Augmented Analytics for Enhanced AutoML Insights and AI-driven Decision Support Systems for Network Management
- AutoML-driven Fire Detection: A Zero-Touch Network Approach Using CNNs and RCNNs
- Anticipated Future Developments and Integration of Emerging Tech in AutoML Networks

River Publishers Series in Automation and Robotics

AUTOMATED MACHINE LEARNING (AUTO ML) FOR ZERO-TOUCH NETWORK AND SERVICE MANAGEMENT

Editors:

Prithi Samuel
Malathy Sathyamoorthy

Rajesh Kumar Dhanaraj
Balamurugan Balusamy

River Publishers Series in Automation, Control and Robotics

ISBN: 9788743810544

e-ISBN: 9788743810551

Available From: July 2026

Price:

KEYWORDS:

Automated machine learning (AutoML); zero-touch network management; autonomous networks; AI-driven networking; network and service management; self-organizing networks; software-defined networking (SDN); network function virtualization (NFV); 5G and 6G networks; intelligent network automation; closed-loop control; AI for telecommunications
